## ABSTRACT OF THE DISCLOSURE

~~In an~~An FM-CW radar ~~for detecting~~detects at least one of the relative distance and the relative speed of a predetermined object based on the frequencies of projection portions observed in the frequency spectrums of beat signals in an ascending-modulation section and a descending-modulation section, where the projection portions are generated by one and the same object; The radar determines the moving speed of a predetermined moving object such as a vehicle or the like having the radar mounted thereon ~~is measured;~~ and the frequency difference between the projection portions observed in the frequency spectrums of the beat signals in the ascending-modulation section and the descending-modulation section is inversely calculated, where the frequency difference corresponds to the stationary object, and a predetermined pair corresponding to the frequency difference is extracted on a priority basis.
